Technical Description

- Possible integration of emergency alarm, camera and intercom
- Traffic information are updated by using integrated GSM modem
- Can be used with any information system of municipal transport operator
- Power consumption 45 W
- Protection IP64
- Operating temperature from -25 °C to +50 °C

Intelligent stops are widely used in municipal transport systems for better orientation of passengers. On top of a support pole there is an LED information panel displaying the following information: name of the stop, date, time, line information such as line direction, time of departure, delay or other information based on customer requirements. Passengers are always informed about the current situation on their route. The bottom line can be used to display non-standard information like alternative transport conditions.
